

Individual Quiz – More on String and File Formatting

Mark the following statements with T for True and F for False.

- Unix and Window systems use different encoding for a new-line.

- There is now only one encoding used for text, named Unicode, (at least according to a UN decision, but the US and Bahrein are not signatories).

- Latin-1 is a text encoding that never throws a “cannot decode” error.

- Python does not allow access to file names in a directory for security purposes.

- UTF-8 is a code that uses different encoding length, from 8b to 32b.
