

Keyboard Input

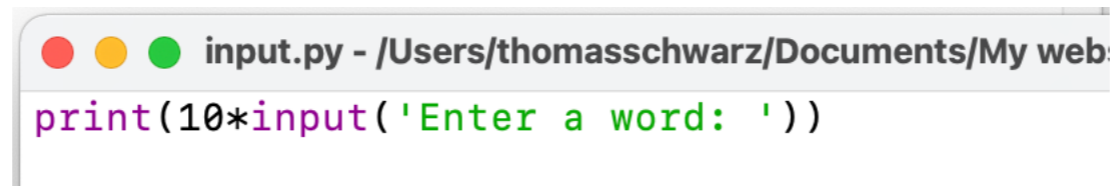

Thomas Schwarz, SJ

Keyboard input

- Computer programs usually need input and output
 - One way to provide input is to get input from the keyboard
 - Done with the `input()` function
 - Argument of `input` is a prompt:
 - The string that appears on the interface asking you to enter something

input

- Example:
 - Create a script
 - Ask user for a word
 - Print out the word repeated 10 times

```
input.py - /Users/thomasschwarz/Documents/My web:  
print(10*input('Enter a word: '))
```

- Notice the space in the prompt
