

# Design Theory for Relational Databases

Thomas Schwarz, SJ

# Contents

- There are many ways a database scheme can be constructed
  - A poorly designed scheme:
    - Has problems with checking constraints
    - Has problems with data coherence
      - E.g. two different spellings of the same person's first name
    - Has problems with performance

# Contents

- Design theory helps to design efficient schemes
  - Functional dependencies
    - Used in the definition of a key
    - Used for flagging potentially bad records
  - Normal forms
    - Get rid of anomalies
    - Get rid of redundant storage of data
- Expand to multivalued dependencies

# Functional Dependencies

- About the nature of data
  - Think about it as the potential contents of a table
  - Instead of the actual contents
- Example:
  - Students can have a double major
  - But an actual set of students might not include a student with double major

# Functional Dependencies

- A form of constraint for a relation
  - **Functional Dependency (FD)** for table  $R(\mathbb{X})$ 
    - FD  $A_1, A_2, \dots, A_n \longrightarrow B_1, B_2, \dots, B_m$ 
      - with  $A_1, \dots, A_n, B_1, \dots, B_m \in \mathbb{X}$
      - If a tuple's values agree for attributes  $A_1, \dots, A_n$
      - Then they agree for attributes  $B_1, B_2, \dots, B_m$

# Functional Dependencies

- Only consider FD with one attribute on the right
  - Because FD  $A_1, A_2, \dots, A_n \longrightarrow B_1, B_2, \dots, B_m$  is equivalent to all of:
    - $A_1, A_2, \dots, A_n \longrightarrow B_1$
    - $A_1, A_2, \dots, A_n \longrightarrow B_2$
    - $\vdots$
    - $A_1, A_2, \dots, A_n \longrightarrow B_m$

# Functional Dependencies

- Example:
  - `Movies1( title, year, length, genre, studioName, starName)`
- Find all FDs

# Functional Dependencies

- `title, year -> length`
- `title, year -> genre`
- `title, year -> studio`
- **However:**
  - `title, year ↗ starName`
    - is not an FD

# Keys

- A **superkey** is a set of attributes in a table that determines all attributes
- $R(A_1, A_2, \dots, A_n)$ 
  - $A_{i_1}, A_{i_2}, \dots, A_{i_m}$  is a superkey if
    - $\forall j : A_{i_1}, A_{i_2}, \dots, A_{i_m} \longrightarrow A_j$

# Keys

- A key is a minimal superkey with respect to set inclusion
  - I.e. A superkey so that no attribute in it can be removed
- If a key consists of a single attribute, then we call the attribute the key instead of the set with only element this attribute

# Functional Dependencies

- Quiz: Given  $R(A, B, C)$  and FDs  $A \rightarrow B$  and  $B \rightarrow C$ ,
- Does this mean  $A \rightarrow C$ ?

# Functional Dependencies

- Answer: Yes.
- Show that all tuples that agree on attribute A also agree on attribute C
  - Called transitivity

# Functional Dependencies

- A set  $S$  of FDs follows from a set  $T$  of FDs if every relation instance satisfying all FDs in  $T$  also satisfies all FDs in  $S$
- Sets of FDs are equivalent if the set of relation instances satisfying one is equal to the set of relation instances satisfying the other one.

# Functional Dependencies

- The splitting rule:
  - $A_1, A_2, \dots, A_n \longrightarrow B_1, B_2, \dots, B_m$  is equivalent to
    - $A_1, A_2, \dots, A_n \longrightarrow B_1$
    - $A_1, A_2, \dots, A_n \longrightarrow B_2$
    - $\vdots$
    - $A_1, A_2, \dots, A_n \longrightarrow B_m$

# Functional Dependencies

- The combining rule:
  - The set of FDs
    - $A_1, A_2, \dots, A_n \longrightarrow B_1$
    - $A_1, A_2, \dots, A_n \longrightarrow B_2$
    - $\vdots$
    - $A_1, A_2, \dots, A_n \longrightarrow B_m$
  - is equivalent to  $A_1, A_2, \dots, A_n \longrightarrow B_1, B_2, \dots, B_m$

# Functional Dependencies

- Quiz: Does  $A_1, A_2, \dots, A_n \longrightarrow B$  imply  $X, A_1, A_2, \dots, A_n \longrightarrow B$ ?

# Functional Dependencies

- Quiz: Does  $A_1, A_2, \dots, A_n \longrightarrow B$  imply  $X, A_1, A_2, \dots, A_n \longrightarrow B$ ?
- Yes:
  - Called augmentation

# Functional Dependencies

- Trivial FDs
  - $A_i \rightarrow A_i$  (Reflexivity)
  - $A, B \rightarrow A$  (Reflexivity & Augmentation)
- Trivial Dependency Rule:
  - $A_1A_2\dots A_n \rightarrow B_1B_2\dots B_m$  is equivalent to
    - $A_1A_2\dots A_n \rightarrow C_1C_2\dots C_r$ 
      - where the  $C_i$  are those of the  $B_i$  that are not among the  $A_i$

# Functional Dependencies

- Closure:
  - Let  $\mathcal{S}$  be a set of functional dependencies
  - Let  $\mathbb{A} = \{A_1, A_2, \dots, A_n\}$  be a set of attributes
  - The **closure** of  $\mathbb{A}$  is the set  $\mathbb{A}^+$  of attributes  $B$  such that every relation that satisfies all the FDs in  $\mathcal{S}$  also satisfies  $A_1, A_2, \dots, A_n \rightarrow B$ .

# Functional Dependencies

- Closure calculation algorithm
    - Input: a set of attributes  $\mathbb{A}$  and a set of functional dependencies  $\mathbb{S}$ .
    - Output:  $\mathbb{A}^+$
1. Split all FDs in  $\mathbb{S}$  so that there is only a single attribute on the right
  2. Set  $\mathbb{X}$  to be  $\mathbb{A}$ .
  3. Repeatedly search for some FD  $B_1, B_2, \dots, B_m \rightarrow C \in \mathbb{S}$  such that  $B_1, B_2, \dots, B_m \in \mathbb{A}$  and  $C \notin \mathbb{A}$ . Then add  $C$  to  $\mathbb{X}$
  4. Stop when the search fails and output  $\mathbb{X} = \mathbb{A}^+$ .

# Functional Dependencies

- Consider the relation scheme  $R = \{E, F, G, H, I, J, K, L, M\}$  and the set of functional dependencies  $\{\{E, F\} \rightarrow \{G\}, \{F\} \rightarrow \{I, J\}, \{E, H\} \rightarrow \{K, L\}, K \rightarrow \{M\}, L \rightarrow \{N\}\}$  on  $R$ . What is the key for  $R$ ?
  - $\{E\}$
  - $\{E, F\}$
  - $\{E, F, H\}$
  - $\{E, F, H, K, L\}$ 
    - Hint: calculate the closure of all possible answers

# Functional Dependencies

- First, normalize  $\{\{E, F\} \rightarrow \{G\}, \{F\} \rightarrow \{I, J\}, \{E, H\} \rightarrow \{K, L\}, K \rightarrow \{M\}, L \rightarrow \{N\}\}$ 
  - $\{\{E, F\} \rightarrow G, \{F\} \rightarrow I, \{F\} \rightarrow J, \{E, H\} \rightarrow K, \{E, H\} \rightarrow L, K \rightarrow M, L \rightarrow N\}$
  - Start with  $\{E\}$ .
    - There is no FD that has only E on the left side
    - $\{E\}^+ = \{E\}$

# Functional Dependencies

- $\{\{E, F\} \rightarrow G, \{F\} \rightarrow I, \{F\} \rightarrow J, \{E, H\} \rightarrow K, \{E, H\} \rightarrow L, K \rightarrow M, L \rightarrow N\}$ 
  - Now try  $\{E, F\} = \mathbb{X}$
  - We can add G to  $\mathbb{X}$ .
  - We can add I to  $\mathbb{X}$ .
  - We can add J to  $\mathbb{X}$ .
  - Then we are stuck:  $\{E, F\}^+ = \{E, F, G, I, J\}$

# Functional Dependencies

- $\{\{E, F\} \rightarrow G, \{F\} \rightarrow I, \{F\} \rightarrow J, \{E, H\} \rightarrow K, \{E, H\} \rightarrow L, K \rightarrow M, L \rightarrow N\}$ 
  - Now try  $\{E, F, H\} = \mathbb{X}$
  - We can add G to  $\mathbb{X}$  because of (1).
  - We can add I to  $\mathbb{X}$  because of (2):  $\mathbb{X} = \{E, F, G, H, I\}$
  - We can add J to  $\mathbb{X}$  because of (3):  $\mathbb{X} = \{E, F, G, H, I, J\}$
  - (4) gives  $\mathbb{X} = \{E, F, G, H, I, J, K\}$
  - (5) gives  $\mathbb{X} = \{E, F, G, H, I, J, K, L\}$
  - (6) gives  $\mathbb{X} = \{E, F, G, H, I, J, K, L, M\}$
  - (7) gives  $\mathbb{X} = \{E, F, G, H, I, J, K, L, M, N\}$
- Therefore  $\{E, F, H\}^+$  contains all the attributes.
  - Since  $\{F, H\}^+ = \{F, H, I, J\}$ ,  $\{E, F, H\}$  is a minimal candidate key and therefore a key.

# Functional Dependencies

- Why does closure work
  - Need to show equivalency of :
    - $B \in \{A_1, A_2, \dots, A_n\}^+$  with regards to  $\mathcal{S}$
    - Every relation fulfilling  $\mathcal{S}$  fulfills  $A_1A_2\dots A_n \rightarrow B$

# Functional Dependencies

- Why does
  - $B \in \{A_1, A_2, \dots, A_n\}^+$  with regards to  $\mathcal{S}$
  - imply
    - Every relation fulfilling  $\mathcal{S}$  fulfills  $A_1A_2\dots A_n \rightarrow B$
- Look at the first time adding an attribute to  $\mathbb{X}$  leads to an FD  $A_1A_2\dots A_n \rightarrow B$  that is **not** true.
  - But  $B$  was added using a FD  $X_1, X_2, \dots, X_m \rightarrow B$
  - Because this is the first time and  $X_1, X_2, \dots, X_m$  follow from the  $A_1A_2\dots A_n$  in all relations,  $A_1A_2\dots A_n \rightarrow X_1, \dots, X_m$
  - Thus, a tuple equal in  $A_1A_2\dots A_n$  is also equal in all  $X_1, \dots, X_m$  and hence equal in  $B$ .
  - Therefore  $A_1A_2\dots A_n \rightarrow B$  has to be true and we have a contradiction

# Functional Dependencies

- Why does
  - Every relation fulfilling  $\mathcal{S}$  fulfills  $A_1A_2\dots A_n \rightarrow B$
  - imply
    - $B \in \{A_1, A_2, \dots, A_n\}^+$  with regards to  $\mathcal{S}$
- Assume  $B \notin \{A_1, A_2, \dots, A_n\}^+$  with regards to  $\mathcal{S}$ , but  $A_1A_2\dots A_n \rightarrow B$  holds in all relations that also fulfill  $\mathcal{S}$ .
  - Create a simple table:

	{A1	A2	...	An}	+	every	thing	else	
•	0	0		0		0	0	...	0
	0	0		0		1	1	...	1

# Functional Dependencies

- Does this instance satisfy  $\mathcal{S}$ ?
  - Assume an FD  $C_1C_2\dots C_r \rightarrow D$  in  $\mathcal{S}$  is violated
    - For a violation to occur, the  $C_i$  need to be on the left side, i.e. in  $\{A_1, A_2, \dots, A_n\}^+$  and the  $D$  on the right side of the table.

$\{A_1, A_2, \dots, A_n\}^+$	every	thing	else
0	0	0	0
0	0	1	1

- But then we did not calculate the closure correctly and  $D$  should have been in  $\{A_1, A_2, \dots, A_n\}^+$

# Functional Dependencies

- Does this instance not satisfy  $A_1A_2\dots A_n \rightarrow B$

$\{A_1$	$A_2$	$\dots$	$A_n\}+$	every	thing	else
0	0		0	0	0	$\dots$ 0
0	0		0	1	1	$\dots$ 1

- Yes!

# Functional Dependencies

- Therefore the assumption is violated and this finishes the proof

# Functional Dependencies

- With the closure calculation, we can prove
  - If in a relation  $R$   $A_1, A_2, \dots, A_m \rightarrow B_1, B_2, \dots, B_n$  and  $B_1, B_2, \dots, B_n \rightarrow C_1, C_2, \dots, C_t$  then  $A_1, A_2, \dots, A_m \rightarrow C_1, C_2, \dots, C_t$
  - Transitivity

# Functional Dependencies

- We sometimes have a choice in the minimal set of FDs that describe a relation
  - A set of FD is called a *basis* if all FDs holding in the relation can be derived from the basis
  - A *minimal basis*  $\mathbb{B}$ :
    - All FDs in  $\mathbb{B}$  have singleton right sides
    - Removing any FD from  $\mathbb{B}$  is no longer a basis
    - If in any FD from  $\mathbb{B}$  we drop an attribute from the right side, then the result is no longer a basis

# Functional Dependencies

- Example:
  - A relation with three attributes such that each attribute determines the other attributes
  - What are the FDs?
  - Find a minimal basis

# Functional Dependencies

- Answer: FDs are
  - $A \rightarrow B, A \rightarrow C$  and all augmentations  $A \rightarrow B, C$  including the trivial ones  $A \rightarrow A, B, A \rightarrow A, C$  and  $A \rightarrow A, B, C$
  - $B \rightarrow A, B \rightarrow C$  plus all augmentation
  - $C \rightarrow A, C \rightarrow B$  plus all augmentations

# Functional Dependencies

- Answer: To obtain a bases, we can look at all subsets of right side singleton
  - $\{A \rightarrow B, A \rightarrow C, B \rightarrow A, B \rightarrow C, C \rightarrow A, C \rightarrow B\}$
  - For example:
    - We try to remove from left
    - $A \rightarrow B$  follows from  $A \rightarrow C$  &  $C \rightarrow B$
    - Left with  
 $\{A \rightarrow C, B \rightarrow A, B \rightarrow C, C \rightarrow A, C \rightarrow B\}$

# Functional Dependencies

- Left with  $\{A \rightarrow C, B \rightarrow A, B \rightarrow C, C \rightarrow A, C \rightarrow B\}$ 
  - Now can get rid of  $B \rightarrow A$
- Left with  $\{A \rightarrow C, B \rightarrow C, C \rightarrow A, C \rightarrow B\}$

# Functional Dependencies

- Another possibility:
  - $\{A \rightarrow B, B \rightarrow C, C \rightarrow A\}$

# Functional Dependencies

- Projecting Functional Dependencies
  - Given a relation  $R$  with a set of FDs  $\mathcal{S}$  and a subset  $L$  of attributes of  $R$ :
    - What are the FDs induced in  $\pi_L(R)$ ?
  - FDs can only involve attributes from  $L$
  - But restricting  $\mathcal{S}$  to those is not enough

# Functional Dependencies

- Algorithm:
  - Start out with an empty set  $\mathbb{T}$  of FDs
  - For each set  $M$  of attributes  $M \subset L$  calculate the closure  $M^+$  in  $R$ 
    - If  $M \rightarrow X$  is a FD calculated this way and  $X \in L$ , add the FD to  $\mathbb{T}$
  - Modify  $\mathbb{T}$  to become a minimal basis
    - Remove all FDs that follow from others in  $\mathbb{T}$
    - Test whether an attribute on the left of a FD in  $\mathbb{T}$  can be removed

# Functional Dependencies

- Example:  $R(A, B, C, D)$  with  
 $\mathcal{S} = \{A \rightarrow B, B \rightarrow C, C \rightarrow D\}$  projected on  
 $L = \{A, C, D\}$
- Calculate first closures
  - $\{A\}^+ = \{A, B, C, D\}$
  - $\{B\}^+ = \{B, C, D\}$
  - $\{C\}^+ = \{C, D\}$
  - $\{D\}^+ = \{D\}$

# Functional Dependencies

- We really do not need any more because those with two attributes on the left would follow trivially
  - Now we add the FDs derived from the closure, if all attributes are in  $L$ 
    - $\mathbb{T} = \{A \rightarrow C, A \rightarrow D, C \rightarrow D\}$
  - This is not a base, because  $A \rightarrow D$  follows from the other ones.
- The induced FDs have base  $\mathbb{T} = \{A \rightarrow C, C \rightarrow D\}$

# Anomalies

- Take

```
movies = (title, year, length, genre, studioName, starName)
```

- **Redundancy** : The studioName for Star Wars is repeated for every star
  - This implies:
- **Update anomaly** : If we update the length of the movie, we need to repeat this update operation for every star or we get incoherent information
- **Delete anomaly** : If we delete all stars from an animation cartoon, we have no information left on the movie!

# Decomposition

- Divide the information over two tables

```
movies = (title, year, length, genre, studioName, starName)
```

- becomes

```
movies1 = (title, year, length, genre, studioName)
```

```
movies2 = (title, year, starName)
```

# Boyce Codd Normal Form

- Relation in BCNF if and only if:
  - Whenever there is a non-trivial FD  $A_1 \dots A_n \rightarrow B$  then  $A_1 \dots A_n$  is a superkey

# Boyce Codd Normal Form

- Example
  - `movies1(title, year, length, genre, studio, star)`
  - Has FD `title, year --> studio`
    - but because of the star attribute, `title, year` is not a key.
  - We can decompose:
    - Take the left side of the FD
    - Calculate its closure
      - `{title, year}+ = {title, year, length, genre, studio}`
      - Decompose into closure and right side
      - `movies(title, year, length, genre, studio)`  
`starsIn(title, year, star)`

# Boyce Codd Normal Form

- What is good about BCNF?
  - Update anomaly
    - Decomposition prevents having to enter the same information multiple times
  - Delete anomaly
    - Can now have movies without stars
- Can we do better?
  - Yes, sometimes. starsIn has still a two-attribute key

# Boyce Codd Normal Form

- Any two attribute table  $R(A, B)$  is in BCNF
  - Proof by case distinction:
    - Case 1:  $A \twoheadrightarrow B, B \twoheadrightarrow A$ 
      - No nontrivial FDs exists,  $R$  is in BCNF
    - Case 2:  $A \rightarrow B, B \twoheadrightarrow A$ 
      - $A$  is the only key and it is on the right of the only non-trivial FD. So BCNF.
    - Case 3:  $A \twoheadrightarrow B, B \rightarrow B$ 
      - Same as before
    - Case 4:  $A \rightarrow B, B \rightarrow A$ 
      - Both  $A, B$  are keys. So, BCNF

# Boyce Codd Normal Form

- Decomposition:
  - Does decomposition lose information or add spurious information?
  - Does decomposition preserve dependencies
  - How do we do decomposition

# Boyce Codd Normal Form

- Finding decompositions
  - Look for a non-trivial FD.
    - If the right side is not a superkey:
    - Expand the right side as much as possible
      - $A_1A_2\dots A_n \rightarrow B_1\dots B_m$
      - Right side are all attributes that are dependent on  $A_1\dots A_n$

# Boyce Codd Normal Form

- Example:
  - `prod(title, year, studio, president, presAddr)`
  - with FD
    - `title year --> studio`
    - `studio --> president`
    - `president --> presAddr`
- Question: What are possible keys?

# Boyce Codd Normal Form

- Two FDs:
  - `studio --> president`
  - `president --> presAddr`
  
- What happens with `studio --> president`

# Boyce Codd Normal Form

- We calculate the closure of the right side
  - `studio → president`
  - `{studio}+ = {president, presAddr}`
- This gives a decomposition
  - `(title, year, studio) (studio, president, presAddr)`
- Using projection of FDs, we get
  - `title, year → studio`
  - `studio → president, president → presAddr`
    - so second relation is not in BCNF (studio is the only key)

# Boyce Codd Normal Form

- Now we decompose the second relation again:
  - (studio, president)
  - (president, presAddr)

# Boyce Codd Normal Form

- Decomposition algorithm
  - If there is an FD  $X \rightarrow Y$  that violates BCNF
    - Calculate  $X^+$
    - Choose  $X^+$  as one relation and  $X \cup \mathcal{C}(X^+)$  as the other
      - All attributes in  $X$  and all attributes not in  $X^+$
    - Calculate the projected FDs
    - Continue

# Boyce Codd Normal Form

- In class exercise.
  - Find all BCNF violations (including those following from the FDs given)
  - Decompose the relation, if possible
- $R(A, B, C, D); AB \rightarrow C; C \rightarrow D; D \rightarrow A$

# Answer

- $R(A, B, C, D); AB \rightarrow C; C \rightarrow D; D \rightarrow A$
- Keys are  $(A, B), (C, B), (D, B)$
- $C \rightarrow D$  violates Boyce Codd
  - $\{C\}^+ = \{C, D, A\}$
  - $X \cup \complement(X^+) = \{C, B\}$ 
    - We find that  $D \rightarrow A$  is still a violation in  $R(A, C, D)$ .
      - $\{D\}^+ = \{D, A\}$
      - Complement is  $\{D, C\}$

# Boyce Codd Normal Form

- In class exercise.
  - Find all BCNF violations (including those following from the FDs given)
  - Decompose the relation, if possible

$R(A, B, C, D); AB \rightarrow C; BC \rightarrow D; CD \rightarrow A; AD \rightarrow B$

# Boyce Codd Normal Form

- In class exercise.
  - Find all BCNF violations (including those following from the FDs given)
  - Decompose the relation, if possible

$R(A, B, C, D); AB \rightarrow C; BC \rightarrow D; CD \rightarrow A; AD \rightarrow B$

# Decomposition

- Recovering data from decomposition
  - Assume a relation  $R(A, B, C)$  with FD  $B \rightarrow C$ , where  $B$  is not a key
    - Decomposition is then  $R_1(A, B)$  and  $R_2(B, C)$
  - Assume  $t = (a, b, c)$  is a tuple. It is projected as  $t_1 = (a, b)$  and  $t_2 = (b, c)$ 
    - Thus,  $t \in R_1 \bowtie R_2$ .
  - Assume  $t_1 = (a, b) \in R_1$  and  $t_2 = (b, c) \in R_2$ , i.e.  $t \in R_1 \bowtie R_2$ 
    - There is a tuple  $(a, b, x) \in R$  because  $R_1$  is a projection.
    - (Similarly, there is a tuple  $(a, y, c) \in R$ .)
    - Because of the FD  $B \rightarrow C$  there is only one value for  $x$
    - Hence, the tuple must have been  $(a, b, x = c)$

# Decomposition

- This argument generalizes to sets  $A, B$ 
  - This means: Boyce Codd decomposition is recoverable
  - Since natural joins are associative and commutative, the BCNF decomposition algorithm cannot lose information

# Decomposition

- Dependency preservation

- Assume a table

`bookings(title, theater, city)`

- FDs `theater --> city`

`title, city --> theater`

- **Keys are:** `title, city` and `title, theater`

# Decomposition

- The existence of the FDs is important
  - Assume a similar decomposition of  $R(A, B, C)$  but without the FDs  $B \rightarrow A$ ,  $B \rightarrow C$
  - Example instance:

A	B	C
1	2	3
4	2	5

- Split into  $R_1(A, B)$  and  $R_2(B, C)$

# Decomposition

- Result of projection

- What is the join of the two tables on the right?

# Decomposition

- Result

- which introduces spurious records.
- Of course, attribute B was not a key for the second relation!

# Dependency Preservation

- Decompose into BCNF
  - `(theater, city)`      `(theater, title)`
  - Must be BCNF, because it only has two attributes
  - However, FD `title, city → theater` cannot be derived

# Decomposition

- Example:

Theater	City
AMC	Wauwatosa
Marcus 1	Milwaukee
Marcus 2	Wauwatosa

Theater	Title
Marcus 2	Doolittle
AMC	Doolittle

- Violates the FD
  - `title, city --> theater`

# Chase Test

- We just saw:  $R(A, B, C)$  with FD  $B \rightarrow C$  has a lossless join into  $R(A, B)$  and  $R(B, C)$
- Without FD  $B \rightarrow C$  or  $B \rightarrow A$ , the join is not loss-less
- Question: Given a set of FDs in  $R$  and a set of sets of attributes  $S_1, S_2, \dots, S_n$ :
  - Is decomposition by projection onto the  $S_i$  lossless?
  - i.e.: is  $\pi_{S_1}(R) \bowtie \pi_{S_2}(R) \bowtie \dots \bowtie \pi_{S_n}(R) = R$  ?

# Chase Test

- Two easy remarks:
  - Natural join is associative and commutative. The order in which we project is not important.
  - Certainly  $R \subset \pi_{S_1}(R) \bowtie \pi_{S_2}(R) \bowtie \dots \bowtie \pi_{S_n}(R)$

# Chase Test

- Chase Test:
  - **Task:** Show that given the FDs, we can prove that
    - $\pi_{S_1}(R) \bowtie \pi_{S_2}(R) \bowtie \dots \bowtie \pi_{S_n}(R) \subset R$
  - Take a tuple  $t \in R$ 
    - Use a tableau to determine the various versions this tuple could appear in the projections

# Chase Test

- Tableau has one row for each decomposition
  - Put down unsubscripted letters for the attributes in the decomposed relationship
  - Put down subscripted letters for the attributes not in the decomposed relationship
    - Subscript is the number of the decomposed relationship

# Chase Test

- Example:  $R(A, B, C, D)$  with projections on  $S_1 = \{A, D\}$ ,  $S_2 = \{A, C\}$  and  $S_3 = \{B, C, D\}$
- A generic tuple in  $S_1 \bowtie S_2 \bowtie S_3$  is then represented in the decomposition tableau

A	B	C	D
$a$	$b_1$	$c_1$	$d$
$a$	$b_2$	$c$	$d_2$
$a_3$	$b$	$c$	$d$

# Chase Test

- The first row looks at the projection on A and D
- From the projection, we know that a given tuple has certain  $a$  and  $d$  values, but the join might give some values for the  $b$  and  $c$  column

A	B	C	D
$a$	$b_1$	$c_1$	$d$
$a$	$b_2$	$c$	$d_2$
$a_3$	$b$	$c$	$d$

# Chase Test

- Once given a tableau, we use the FDs in order to “chase down” identities between the elements in the tableau.
- We represent them by making subscripts equal or dropping them

# Chase Test

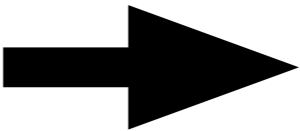

- Example:
  - Assume the following FDs for the example:
    - $A \rightarrow B, B \rightarrow C, CD \rightarrow A$
  - Whenever we have tableau entries for attributes on the right side, we can use it to equalize the entries for attributes on the right of an FD

A	B	C	D
<i>a</i>	<i>b<sub>1</sub></i>	<i>c<sub>1</sub></i>	<i>d</i>
<i>a</i>	<i>b<sub>2</sub></i>	<i>c</i>	<i>d<sub>2</sub></i>
<i>a<sub>3</sub></i>	<i>b</i>	<i>c</i>	<i>d</i>

# Chase Test

- Use  $A \rightarrow B$ :
  - First two rows, we have unsubscripted  $a$ .
  - Equalize the B column in these rows

A	B	C	D
$a$	$b_1$	$c_1$	$d$
$a$	$b_2$	$c$	$d_2$
$a_3$	$b$	$c$	$d$

A	B	C	D
$a$	$b_1$	$c_1$	$d$
$a$	$b_1$	$c$	$d_2$
$a_3$	$b$	$c$	$d$

# Chase Test

- Use FD  $B \rightarrow C$

# Chase Test

- Now use  $CD \rightarrow A$

A	B	C	D
<i>a</i>	<i>b</i> <sub>1</sub>	<i>c</i>	<i>d</i>
<i>a</i>	<i>b</i> <sub>1</sub>	<i>c</i>	<i>d</i> <sub>2</sub>
<i>a</i> <sub>3</sub>	<i>b</i>	<i>c</i>	<i>d</i>

A	B	C	D
<i>a</i>	<i>b</i> <sub>1</sub>	<i>c</i>	<i>d</i>
<i>a</i>	<i>b</i> <sub>1</sub>	<i>c</i>	<i>d</i> <sub>2</sub>
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>

# Chase Test

- Now we have one row that is equal to  $t$ 
  - This means: any tuple of the join **has** to be equal to the original tuple

# Chase Test

- What happens if after applying all FDs, we still are left with unsubscripted variables?
  - Then this gives us a value in the join that is not in the original relation

# Chase Test

- Example:
  - $R(A, B, C, D)$  with FDs  $B \rightarrow AD$ 
    - $\{B\}^+ = \{B, A, D\}$ , so Boyce-Codd would split into
      - $R(B, C)$  and  $R(A, B, D)$
  - But we decompose into  $\{A, B\}$ ,  $\{B, C\}$ ,  $\{C, D\}$

# Chase Test

- Example:
  - $R(A, B, C, D)$  with FDs  $B \rightarrow AD$  and decomposition into  $\{A, B\}, \{B, C\}, \{C, D\}$

- Initial tableau is

A	B	C	D
$a$	$b$	$c_1$	$d_1$
$a_2$	$b$	$c$	$d_2$
$a_3$	$b_3$	$c$	$d$

# Chase Test

- Example:
  - $R(A, B, C, D)$  with FDs  $B \rightarrow AD$  and decomposition into  $\{A, B\}, \{B, C\}, \{C, D\}$

- Initial tableau is

A	B	C	D
$a$	$b$	$c_1$	$d_1$
$a_2$	$b$	$c$	$d_2$
$a_3$	$b_3$	$c$	$d$

- After applying the FD, we get tableau

A	B	C	D
$a$	$b$	$c_1$	$d_1$
$a$	$b$	$c$	$d_1$
$a_3$	$b_3$	$c$	$d$

# Chase Test

- Take this tableau and use it to construct a counter example

A	B	C	D
$a$	$b$	$c_1$	$d_1$
$a$	$b$	$c$	$d_1$
$a_3$	$b_3$	$c$	$d$

- Create tuples  $(a, b, c_1, d_1)$ ,  $(a, b, c, d_1)$ ,  $(a_3, b_3, c, d)$  in  $R$ .

- Fulfills the FD  $B \rightarrow CD$

- Projections are

A	B	B	C	C	D
$a$	$b$	$b$	$c_1$	$c_1$	$d_1$
$a_3$	$b_3$	$b$	$c$	$c$	$d_1$
		$b_3$	$c$	$c$	$d$

# Chase Test

- Join these together:

A	B
<i>a</i>	<i>b</i>
<i>a<sub>3</sub></i>	<i>b<sub>3</sub></i>

B	C
<i>b</i>	<i>c<sub>1</sub></i>
<i>b</i>	<i>c</i>
<i>b<sub>3</sub></i>	<i>c</i>

C	D
<i>c<sub>1</sub></i>	<i>d<sub>1</sub></i>
<i>c</i>	<i>d<sub>1</sub></i>
<i>c</i>	<i>d</i>

- Result has two additional rows

A	B	C	D
<i>a</i>	<i>b</i>	<i>c<sub>1</sub></i>	<i>d<sub>1</sub></i>
<i>a</i>	<i>b</i>	<i>c</i>	<i>d<sub>1</sub></i>
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>
<i>a<sub>3</sub></i>	<i>b<sub>3</sub></i>	<i>c</i>	<i>d<sub>1</sub></i>
<i>a<sub>3</sub></i>	<i>b<sub>3</sub></i>	<i>c</i>	<i>d</i>

- The decomposition is not loss-less!

# Example

- Let  $R(A, B, C, D, E)$  be decomposed into  $\{A, B, C\}$ ,  $\{B, C, D\}$ ,  $\{A, C, E\}$ . Assume FDs  $A \rightarrow D$ ,  $CD \rightarrow E$ ,  $E \rightarrow D$ . Is the decomposition lossless?

# Example

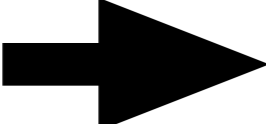

- Let  $R(A, B, C, D, E)$  be decomposed into  $\{A, B, C\}$ ,  $\{B, C, D\}$ ,  $\{A, C, E\}$ . Assume FDs  $A \rightarrow D$ ,  $CD \rightarrow E$ ,  $E \rightarrow D$ . Is the decomposition lossless?

A	B	C	D	E
$a$	$b$	$c$	$d_1$	$e_1$
$a_2$	$b$	$c$	$d$	$e_2$
$a$	$b_3$	$c$	$d_3$	$e$

# Example

- Let  $R(A, B, C, D, E)$  be decomposed into  $\{A, B, C\}$ ,  $\{B, C, D\}$ ,  $\{A, C, E\}$ . Assume FDs  $A \rightarrow D$ ,  $CD \rightarrow E$ ,  $E \rightarrow D$ . Is the decomposition lossless?
- Use FD  $A \rightarrow D$

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i> <sub>1</sub>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>3</sub>	<i>e</i>

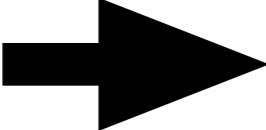

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i> <sub>1</sub>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>

# Example

- Let  $R(A, B, C, D, E)$  be decomposed into  $\{A, B, C\}$ ,  $\{B, C, D\}$ ,  $\{A, C, E\}$ . Assume FDs  $A \rightarrow D$ ,  $CD \rightarrow E$ ,  $E \rightarrow D$ . Is the decomposition lossless?
- Use FD  $CD \rightarrow E$

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i> <sub>1</sub>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>

# Example

- Let  $R(A, B, C, D, E)$  be decomposed into  $\{A, B, C\}$ ,  $\{B, C, D\}$ ,  $\{A, C, E\}$ . Assume FDs  $A \rightarrow D$ ,  $CD \rightarrow E$ ,  $E \rightarrow D$ . Is the decomposition lossless?
- Cannot use FD  $E \rightarrow D$ ,  $A \rightarrow D$ ,  $CD \rightarrow E$

A	B	C	D	E
$a$	$b$	$c$	$d_1$	$e$
$a_2$	$b$	$c$	$d$	$e_2$
$a$	$b_3$	$c$	$d_1$	$e$

# Example

- The tableau gives us tuples that satisfy the FDs
- Make the tableau into tuples
- Look at the projections

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>

A	B	C
<i>a</i>	<i>b</i>	<i>c</i>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>

B	C	D
<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>
<i>b</i>	<i>c</i>	<i>d</i>
<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>

A	C	E
<i>a</i>	<i>c</i>	<i>e</i>
<i>a</i> <sub>2</sub>	<i>c</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>c</i>	<i>e</i>

# Example

- Join them

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>

A	B	C
<i>a</i>	<i>b</i>	<i>c</i>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>

B	C	D
<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>
<i>b</i>	<i>c</i>	<i>d</i>
<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>

A	C	E
<i>a</i>	<i>c</i>	<i>e</i>
<i>a</i> <sub>2</sub>	<i>c</i>	<i>e</i> <sub>2</sub>

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i> <sub>2</sub>
<i>a</i> <sub>2</sub>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i> <sub>2</sub>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i>
<i>a</i>	<i>b</i> <sub>3</sub>	<i>c</i>	<i>d</i> <sub>1</sub>	<i>e</i> <sub>2</sub>

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Create a tableau with one row for each decomposition

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Create a tableau with one row for each decomposition
  - This represent potential values in the join

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>2</sub>	d <sub>2</sub>	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>3</sub>	d <sub>3</sub>	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>5</sub>	d <sub>5</sub>	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Start with  $A \rightarrow C$ : Any tuple with the same A-value gets simplified

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>2</sub>	d <sub>2</sub>	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>3</sub>	d <sub>3</sub>	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>5</sub>	d <sub>5</sub>	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Start with  $A \rightarrow C$ : Any tuple with the same A-value gets simplified

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>2</sub>	d <sub>2</sub>	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>3</sub>	d <sub>3</sub>	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>5</sub>	d <sub>5</sub>	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Start with  $A \rightarrow C$ : Any tuple with the same A-value gets simplified

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>2</sub>	d <sub>2</sub>	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>3</sub>	d <sub>3</sub>	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>5</sub>	d <sub>5</sub>	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Start with  $A \rightarrow C$ : Any tuple with the same A-value gets simplified

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d <sub>2</sub>	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>3</sub>	d <sub>3</sub>	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>1</sub>	d <sub>5</sub>	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Start with  $A \rightarrow C$ : Any tuple with the same A-value gets simplified

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d <sub>2</sub>	e <sub>2</sub>

- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $C \rightarrow D$ :

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d <sub>2</sub>	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>1</sub>	d <sub>3</sub>	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>1</sub>	d <sub>5</sub>	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $C \rightarrow D$ :

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>1</sub>	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>1</sub>	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $DE \rightarrow C$ :

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>1</sub>	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>1</sub>	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
- Apply  $DE \rightarrow C$ : Unify the C-value if the D and E value are same

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c <sub>1</sub>	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c <sub>1</sub>	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
- Apply  $DE \rightarrow C$ : Unify the C-value if the D and E value are same

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
- Apply  $DE \rightarrow C$ : Unify the C-value if the D and E value are same

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $CE \rightarrow A$

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $CE \rightarrow A$

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $CE \rightarrow A$

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a <sub>3</sub>	b	c	d	e
a <sub>4</sub>	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $CE \rightarrow A$

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a	b	c	d	e
a	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
  - Apply  $CE \rightarrow A$

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a	b	c	d	e
a	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
- While we can continue, we do not have to:

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a	b	c	d	e
a	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- $R(ABCDE)$  decomposed into  $R_1(AD)$ ,  $R_2(AB)$ ,  $R_3(BE)$ ,  $R_4(CDE)$ ,  $R_5(AE)$
- Functional dependencies are  $A \rightarrow C$ ,  $B \rightarrow C$ ,  $C \rightarrow D$ ,  $DE \rightarrow C$ , and  $CE \rightarrow A$
- Now chase using functional dependencies
- Middle row has no indexed values:

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a	b	c	d	e
a	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Another Example

- This shows that the decomposition has a lossless join

A	B	C	D	E
a	b <sub>1</sub>	c <sub>1</sub>	d	e <sub>1</sub>
a	b	c <sub>1</sub>	d	e <sub>2</sub>
a	b	c	d	e
a	b <sub>4</sub>	c	d	e
a	b <sub>5</sub>	c	d	e

# Third Normal Form

- Decomposition
  - Avoid update and delete anomalies
  - Guarantee lossless joins
    - Decomposition **does not** generate spurious data
- Want to check functional dependencies in the derived tables

# Third Normal Form

- Sometimes, checking FDs is impossible
  - **Example:**  $R(\text{street}, \text{city}, \text{zip})$ 
    - $\text{street}, \text{city} \rightarrow \text{zip}$
    - $\text{zip} \rightarrow \text{city}$
  - **Bring into BCNF:**  $\{\text{street}, \text{city}\}$  and  $\{\text{street}, \text{zip}\}$  are keys,  $\text{zip} \rightarrow \text{city}$  violates BCNF
  - **Decompose into**  $R1(\text{zip}, \text{city}), R2(\text{zip}, \text{street})$
  - **But now we cannot check**  $\text{street}, \text{city} \rightarrow \text{zip}$

# Third Normal Form

- Example:

street	zip
--------	-----

123 Wisconsin Avenue 53230

123 Wisconsin Avenue 53231

city	zip
------	-----

Milwaukee 53230

Milwaukee 53231

- looks fine

# Third Normal Form

- But join gives:

street	city	zip
123 Wisconsin Avenue	Milwaukee	53230
123 Wisconsin Avenue	Milwaukee	53231

- which violates a FD

# Third Normal Form

- So we should not do this.
- “Elegant” solution: define the problem away
  - The original table needs to be “normal”
- A relation is in *third normal form* iff
  - For every non-trivial FD  $X \rightarrow A$ 
    - $X$  is a superkey
    - $A$  is prime (member of at least one key)

# Third Normal Form

- A relation  $R$  is in ***third normal form***
  - If  $A_1A_2\dots A_n \rightarrow B_1B_2\dots B_m$  is a non-trivial FD, then
    - either  $\{A_1, A_2, \dots, A_n\}$  is a superkey
    - or those of  $\{B_1, B_2, \dots, B_m\}$  not in  $\{A_1, A_2, \dots, A_n\}$  are each member of *some* key (not necessarily the same)
- Attributes that are part of some key are called ***prime***

# Third Normal Form

- Example:
  - `bookings(title, theater, city)`  
  
`theater --> city`  
  
`title, city --> theater`
  - is in third normal form
    - city is part of a key

# Third Normal Form

- Example:
  - `addresses(city, street, zip)`  
  
`zip --> city`  
  
`city, street --> zip`
  - is in third normal form
    - zip is prime

# Third Normal Form

- Creation of 3NF Schemas
  - Want to decompose a relation  $R$  into a set of relations such that
    - All relations in the set are in 3NF
    - The decomposition has a lossless join
    - The decomposition preserves dependencies

# Third Normal Form

- Synthesis Algorithm
  - Given a relation  $R$  and a set  $\mathbb{F}$  of FDs
    - Find a minimal base  $\mathbb{G}$  for  $\mathbb{F}$
    - For all FD  $X \rightarrow A \in \mathbb{G}$ : use  $XA$  as a schema
    - If none of the relation schemas from previous step are a superkey for  $R$ , add another relation whose schema is a key for  $R$

# Third Normal Form

- Example:
  - $R(A, B, C, D, E)$  with FDs  $AB \rightarrow C$ ,  $C \rightarrow B$ ,  $A \rightarrow D$

# Third Normal Form

- Example:
  - The FDs are their own base:
    - Show: None of  $AB \rightarrow C$ ,  $C \rightarrow B$ ,  $A \rightarrow D$  follows from the other two
    - Show: Cannot drop an attribute from a right side

# Third Normal Form

- Example:  $R(A, B, C, D, E)$  with FDs  $AB \rightarrow C$ ,  $C \rightarrow B$ ,  $A \rightarrow D$
- This gives relations
  - $S_1(A, B, C)$ ,  $S_2(B, C)$ ,  $S_3(A, D)$
  - Keys of  $R$  are  $A, B, E$  and  $A, C, E$ 
    - Need to add one of them
  - $S_1(A, B, C)$ ,  $S_2(B, C)$ ,  $S_3(A, D)$ ,  $S_4(A, C, E)$

# Third Normal Form

- Why does this work
  - Lossless join:
    - We use the “Chase”
      - There is one subset of attributes in the decomposition that is a superkey  $\mathbb{K}$ .
      - The closure of  $\mathbb{K}$  is all the attributes.
      - We start with a tableau

# Third Normal Form

- Lossless join -- Chase
  - Use the FDs used in calculating the closure of  $\mathbb{K}$ .
  - We can assume that the FDs are in the base
  - Let the first FD be  $X \supset A \rightarrow B$ .
    - Tableau:

	$A$	$X \setminus A$	$B$	rest of attributes
row $\mathbb{K}$	$r, s, t, e, f,$		$b1$	**
row FD	$r, s$	$t1 e1 f1$	$b$	**

- The application of the FD sets  $b1$  to  $b$

# Third Normal Form

- Lossless join -- Chase
  - We continue the process.
    - Next FD might use column  $B$  or not, but because of it, we lose the subscript in the column corresponding to the right side
  - Eventually, we have removed all subscripts in the first row
  - Therefore, the decomposition is loss-less

# Third Normal Form

- Dependency Preservation
  - Any FD is the consequence of the FDs in the base
  - Any FD in the base is represented by a relation in the decomposition
  - Therefore, we can first check those and as a consequence get all the FDs

# Third Normal Form

- Is the decomposition in third normal form
  - If we add a relation that corresponds to a key, then this relation is by definition in third normal form
  - If we add a relation that corresponds to an FD in the basis:
    - **Can show:** If the relation is not in 3NF, then the basis is not minimal

# Multivalued Dependencies

- First Normal Form: All values in a relation are atomic
  - This is removed by object-relational databases
- If the value of an attribute is a set, we represent it by using many relations

A	B	C
1	2	{3, 4}
4	5	{3, 4}

A	B	C
1	2	3
1	2	4
4	5	3
4	5	4

# Multivalued Dependencies

- A more practical example
  - Relation `course(number, book, lecturer)`
- In this department, the books recommended and the lecturers are independent.

- |                   |                |                |                   |                |                      |
|-------------------|----------------|----------------|-------------------|----------------|----------------------|
| <code>calc</code> | <code>1</code> | <code> </code> | <code>Ross</code> | <code> </code> | <code>Krenz</code>   |
| <code>calc</code> | <code>1</code> | <code> </code> | <code>Lang</code> | <code> </code> | <code>Krenz</code>   |
| <code>calc</code> | <code>1</code> | <code> </code> | <code>Ross</code> | <code> </code> | <code>Sanders</code> |
| <code>calc</code> | <code>1</code> | <code> </code> | <code>Lang</code> | <code> </code> | <code>Sanders</code> |
| <code>calc</code> | <code>2</code> | <code> </code> | <code>Ash</code>  | <code> </code> | <code>Gillen</code>  |
| <code>calc</code> | <code>2</code> | <code> </code> | <code>Ash</code>  | <code> </code> | <code>Engbers</code> |
| <code>calc</code> | <code>1</code> | <code> </code> | <code>Ross</code> | <code> </code> | <code>Schwarz</code> |
| <code>calc</code> | <code>1</code> | <code> </code> | <code>Lang</code> | <code> </code> | <code>Schwarz</code> |

# Multivalued Dependencies

- The same list can be expressed using sets more simply

```
calc 1 | Ross | Krenz
calc 1 | Lang | Krenz
calc 1 | Ross | Sanders
calc 1 | Lang | Sanders
calc 2 | Ash | Gillen
calc 2 | Ash | Engbers
calc 1 | Ross | Schwarz
calc 1 | Lang | Schwarz
```

```
calc1 | {Ross, Lang} | {Krenz, Sanders, Schwarz}
calc2 | {Ash} | {Gillen, Engbers}
```

# Multivalued Dependencies

- It would be an error to add a single tuple
  - `calc 1 | Burlow | Krenz`
- to the relation
  - indicating that an additional book is now recommended
- Instead, need to add:
  - `calc 1 | Burlow | Sanders`
  - `calc 1 | Burlow | Schwarz`
- as well

# Multivalued Dependencies

- This gives rise to the definition of a multivalued dependency
  - Unlike before, we now demand that additional tuples exist in the relation.

# Multivalued Dependencies

- Formally:  $A_1, A_2, \dots, A_n \twoheadrightarrow B_1, \dots, B_m$
- Whenever
  - two tuples agree on its values in  $A_1, A_2, \dots, A_n$
  - the tuples have values  $b_1 \dots b_m$  and  $b'_1 \dots b'_m$  in  $B_1, B_2, \dots, B_m$
  - the tuples have values  $x_1 \dots x_r$  and  $x'_1 \dots x'_r$  in the other attributes
  - then the tuples  $a_1 \dots a_n b'_1 \dots b'_m x_1 \dots x_r$  and  $a'_1 \dots a'_n b_1 \dots b_m x'_1 \dots x'_r$  also exist

# Multivalued Dependencies

- For each pair of tuples  $t$  and  $u$  of a relation  $R$  that agree on all attributes  $A_1, A_2, \dots, A_n$  :
  - We can find another tuple  $v$  such that  $v$  agrees :
    - With both  $t$  and  $u$  on  $A_1, A_2, \dots, A_n$
    - With  $t$  on  $B_1, B_2, \dots, B_m$
    - With  $u$  on all attributes that are not among the  $A$ s and  $B$ s

# Multivalued Dependencies

- Example

- Relation courses

```
calc 1 | Ross | Krenz
calc 1 | Lang | Krenz
calc 1 | Ross | Sanders
calc 1 | Lang | Sanders
calc 2 | Ash | Gillen
calc 2 | Ash | Engbers
calc 1 | Ross | Schwarz
calc 1 | Lang | Schwarz
```

- has FD  $\text{course} \twoheadrightarrow \text{book}$  and  $\text{course} \twoheadrightarrow \text{lecturer}$

# Multivalued Dependencies

- Example `stars(name, address, movie)`
  - A star can have several address and can be in several movies
  - But: for each movie, all addresses of the star need to appear
  - But: for each address, all movies need to appear

# Multivalued Dependencies

- Trivial MVD
  - If  $\{B_1, \dots, B_m\} \subset \{A_1, \dots, A_n\}$  then
    - $A_1 \dots A_n \twoheadrightarrow B_1 \dots B_m$

# Multivalued Dependencies

- Transitive MVDs
  - $A_1 \dots A_n \twoheadrightarrow B_1 \dots B_m$  and  $B_1 \dots B_m \twoheadrightarrow C_1 \dots C_k$  implies  $A_1 \dots A_n \twoheadrightarrow C_1 \dots C_k$
  - Provided that we remove any C-attributes that are also A-attributes

# Multivalued Dependencies

- Splitting is **NOT** true
  - `stars(name, street, city, title, year)`
- has MVD
  - `name → street, city`
- **However, `name → street` is not true.**
  - `John Wayne, 123 Elm Street, Malibu, Hatari, 1962`
  - `John Wayne, 456 Overland, Culver City, Hatari, 1962`
  - `John Wayne, 123 Elm Street, Malibu, Shootist, 1976`
  - `John Wayne, 456 Overland, Culver City, Shootist, 1976`
  - **DOES NOT HAVE**
  - `John Wayne, 123 Elm Street, Culver City, Hatari, 1962`

# Multivalued Dependencies

- Promotion
  - Any FD is also an MVD

# Multivalued Dependencies

- Complementation
  - If  $A_1 \dots A_n \twoheadrightarrow B_1 \dots B_m$  and  $C_1 \dots C_k$  are the attributes not in the As and Bs, then  $A_1 \dots A_n \twoheadrightarrow C_1 \dots C_k$

# Fourth Normal Form

- A relation is in fourth normal form if whenever  $A_1 \dots A_n \twoheadrightarrow B_1 \dots B_m$  is a non-trivial MVD
- Then  $A_1 \dots A_n$  is a super-key

# Normal Forms

- We have  $4NF \Rightarrow BCNF \Rightarrow 3NF$

- 

	3NF	BCNF	4NF
eliminate redundancies due to FDs	no	yes	yes
eliminates redundancies due to MVDs	no	no	yes
preserves FDs	yes	no	no
preserves MVDs	no	no	no
lossless joins	yes	yes	yes
