

Individual Quiz

Name: _____

The following defines a class `TwoDVector`. Write a `__dunder__` method that implements the `__str__` function. The output of the test should be

`(2, 3)`

```
class TwoDVector:
    def __init__(self, a1, a2):
        self.one = a1
        self.two = a2
    def __repr__(self):
        return "TwoDVector one: {}, two: {}".format(
            self.one,
            self.two)
    def __str__(self):
        Your code here

if __name__ == "__main__":
    vector = TwoDVector(2, 3)
    print(vector)
```
